

Experiment -2

Building an SoC by interfacing GPIO-LED with ARM Cortex M0

Introduction

The purpose of this experiment is to build a System on Chip-Integrating the GPIO-LED peripheral with ARM Cortex M0 processor using AHB Lite Bus.

Objective

Toggle the LEDs for the data 2,4,6,8,A,C,E and roll over.

Software tools Requirement

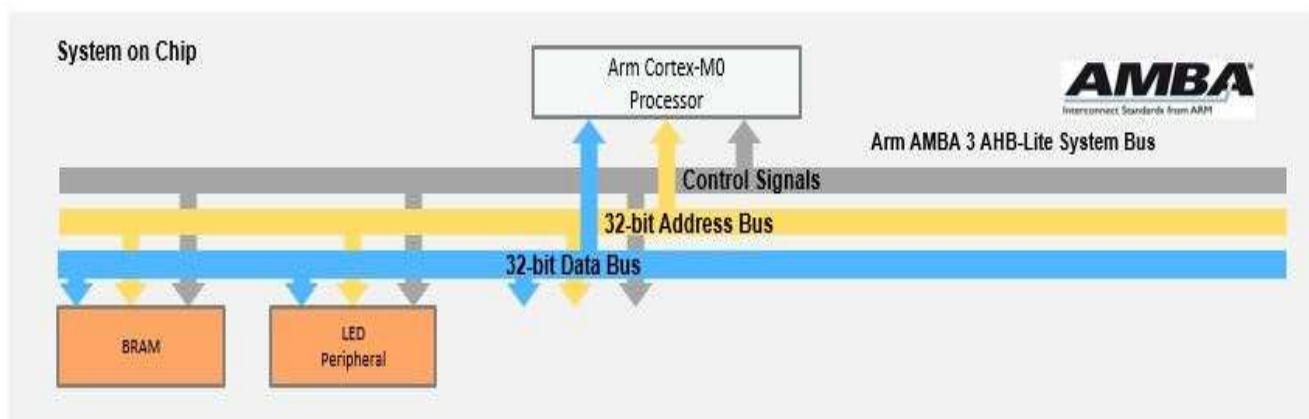

Modelsim (Siemens)/ Xilinx Vivado/ Icarus Verilog

ARM Keil μ vision 5.37

Software programming:

Program the Cortex-M0 processor using arm assembly language and generate the hex file using **arm Keil μ vision 5.37**

Block Diagram

Memory Map of Peripherals

Peripheral	Base address	End address	Size
MEM	0x0000_0000	0x0000_FFFF	16MB
LED	0x5000_0000	0x50FF_FFFF	16MB

Outcome

After this experiment, the learner would get a basic idea about designing a simple SoC based on arm cores, how to interface peripherals to the core using the AHB Lite bus, and how to program the processor using Assembly language
